Why Mars?

- There is scientific evidence that Mars was once a warm and wet planet like Earth and, therefore, it might have had the conditions necessary for the origin of life.
- ***Question: Was there life on Mars in the distant past or present?***
- The main objective of Mars exploration since Mars Pathfinder has been to determine if the basic elements needed for the origin of life were ever present in Mars.
- Future missions will attempt to find direct evidence of past or present life.

Labeled Release Experiment: The Results

Labeled Release Experiment: No Life!!

Certain chemical reactions, suggested by members of the MAT and other chemists, could conceivably produce the "positive" biological results in both experiments. At right, the sequence of reactions suggested by John Oro are summarized on the blackboard.

The Mars Science Strategy: “Follow the Water”

- When was it present on the surface?
- How much and where?
- Where did it go, leaving behind the features evident on the surface Mars?
- Did it persist long enough for life to have developed?

WATER

LIFE

Understand the potential for life elsewhere in the Universe

CLIMATE

Characterize the present and past climate and climate processes

GEOLOGY

Understand the geological processes affecting Mars' interior, crust, and surface

Prepare for Human Exploration

Develop Knowledge & Technology Necessary for Eventual Human Exploration

Sources of Horizontal Velocity

Mars Exploration Rover

- **Definitions:**

- *Initial Horizontal Velocity*

- Steady State winds
 - Parachute instability (I.e. trim angle) induced

- *RAD Induced Horizontal Velocity*

- Wind Shear
 - Parachute instability
 - Uncontrolled
 - RAD rockets thrust mismatch induced
 - RAD rockets misalignment induced
 - Backshell c.o.m. offset induced
 - Bridal confluence point offset induced

Initial Horizontal Velocity RAD Induced Horizontal Velocity

$$V_h(t_{bc}) = V_h(t_{RAD}) + \int F_{RAD}/m * \sin(\beta) dt$$

- **Example:**

- a 20 degrees Bridle Angle angle results in an horizontal velocity of 29 m/s

TIRS Control

Mars Exploration Rover

- **Add three small rockets aimed at the backshell c.o.m. to impart impulsively a transverse delta-V to the backshell in order to reduce the average off-nadir angle during RAD firing.**
 - Transverse Impulse Rocket System (TIRS)
 - Backshell $\Delta V = 5$ m/sec
 - 40 degrees bridle angle correction in 3.3 sec of RAD firing
 - TIRS burn duration < 0.5 seconds

Bridle Cut

2003: The Skycrane maneuver is born

Motivation Behind The SkyCrane

Touchdown Velocity:

- $V_v = 12 \text{ m/sec}$
- $V_h < 16 \text{ m/sec}$

Touchdown Velocity:

- $V_v = 2.4 \text{ m/sec}$
- $V_h < 1.4 \text{ m/sec}$

Touchdown Velocity:

- $V_v = 0.75 \text{ m/sec}$
- $V_h < 0.5 \text{ m/sec}$

- Robust to rocks
- Robust to local slopes
- Proven but hard rover egress
- Sensitive to winds
- Difficult to scale up

- Robust to winds
- Dedicated Touchdown Detection
- Sensitive to local slopes
- Sensitive to rocks
- Difficult rover egress

- Robust to winds
- Robust to local slopes
- Robust to rocks
- Simple touchdown detection
- No rover egress problem

Mars 2020 Mission Overview

LAUNCH

- MSL Class/Capability LV
- Period: Jul/Aug 2020

CRUISE/APPROACH

- 7.5 month cruise
- Arrive Feb 2021

ENTRY, DESCENT & LANDING

- MSL EDL system (Range Trigger baselined, Terrain Relative Navigation funded thru PDR): guided entry and powered descent/Sky Crane
- 16 x 14 km landing ellipse (range trigger baselined)
- Access to landing sites $\pm 30^\circ$ latitude, ≤ -0.5 km elevation
- Curiosity-class Rover

SURFACE MISSION

- 20 km traverse distance capability
- Seeking signs of past life
- Returnable cache of samples
- Prepare for human exploration of Mars

Mars 2020 Instrument Payload Accommodated on Rover

The 2020 Mars Rover mission offers many important advances relative to MER and MSL:

The ability to collect compelling samples for potential future return

Payload designed to recognize potential biosignatures in outcrop

Measurements of fine-scale mineralogy, chemistry, and texture in outcrop (petrology)

Prepare for the future human exploration of Mars

Terrain Relative Navigation

Mars Helicopter for 2020?

Artist's Concept

Conclusions

- Mars has provided a challenging destination that has resulted in the development of multiple EDL/GN&C architectures with different cost, risk, and performance
- Low cost solutions were successfully developed such as the MPF/MER airbag landers and the Phoenix soft-lander
- In order to meet the large improvement in landing accuracy and delivered payload, MSL enlisted GN&C early in the design cycle and developed the appropriate sensor and actuators required for the task
 - SkyCrane: Tightly integrated mechanical/GN&C design. GN&C is part of the Touchdown system
- Future improvements in EDL performance (Hazard Detection & Avoidance, Pinpoint Landing) will require the development of new, and maybe costly, GN&C sensors and actuators, and new ways of testing the full end-to-end system
